Step 2 · Work from a source

Start with your teaching notes.

Use the fictional source below or your own non-sensitive material. The scaffold quotes numbered passages and adds activities for you to adapt.

Source material

Water in an open dish can slowly change into water vapour. This change is called evaporation. The speed depends on conditions, including temperature and exposed surface area.

In a classroom observation, compare equal amounts of water in identical dishes. Record the conditions and the change over time. A single observation has limits; repeat and compare before drawing a general conclusion.

# Evaporation classroom draft

Audience: Class 6 science
Learning objective: Explain evaporation using an
observation.

## Read and notice
[S1] Water in an open dish can slowly change into
water vapour. This change is called evaporation.
The speed depends on conditions, including
temperature and exposed surface area.

[S2] In a classroom observation, compare equal
amounts of water in identical dishes. Record the
conditions and the change over time. A single
observation has limits; repeat and compare before
drawing a general conclusion
```
